1720 Peachtree Road, N.W.
Atlanta, Ga. 30367

PREFACE

The Forest Service is indebted to Philip C. Wakeley, longtime silviculturist with the Southern Forest Experiment Station, for researching and writing the first practical guides for artificial reforestation with the four major southern pine species. Mr. Wakeley, in turn, credits F.O. (Red) Bateman, Head Ranger of the old Great Southern Lumber Company, Bogalusa, La., for developing some of the planting techniques generally used today with southern pine. Mr. Bateman began his efforts in 1919-20 and, by the end of the 1925-26 season, had successfully reforested 12,700 acres (5,139.7 ha) mostly by planting. At that time, there was no other successful planting, south of Biltmore, N.C., of more than 100 acres (40.5 ha). Since then, more than 28 million acres (11.3 million ha) have been planted or seeded in the South.

The first great reforestation effort was in the Civilian Conservation Corps (CCC) era, 1935-42. Large scale industrial tree planting started about 1948, and has continued at an increasing rate ever since. The Soil Bank Program of 1956-61 was responsible for the planting of 1,922,604 acres (778,078 ha) on small private ownerships. From 1936-79, 3,746,785 acres (1,516,324 ha) have been planted on small ownerships under the Agricultural Conservation Program. Presently, about 1.5 million acres (607,050 ha) are planted annually, mainly by industry, but approximately 192,000 acres (77,702 ha) are planted under the Forestry Incentives Program and 43,000 acres (17,402 ha) under the State cost-sharing programs in Mississippi, North Carolina and Virginia.

A statistical history of tree planting in the South is presented in the following pages. It includes statistics published each year by the Forest Service in ***Tree Planters' Notes*** since 1951. Data for earlier years is from the files in the Forest Service's Washington Office, the Tennessee Valley Authority (TVA), the various States, and some industrial organizations that planted trees before World War II. The data was sometimes fragmented and, where there was more than one source, often incompatible. Only a few records were kept during the war years of 1942-44.

It has been necessary to make several assumptions. For these and other rationalizations I take sole responsibility. The number of seedlings planted before 1947 are assumed to have been converted to acres planted by dividing by 1,200. After 1946, the

conversion rate was 1,000 per acre until the 1970's, when it was reduced to either 700 or 800 per acre. During the CCC days, the Forest Service presumably planted National Forest land and the Soil Conservation Service (SCS) planted small ownerships (unless specifically stipulated, such as on Land Use Projects). The earliest TVA plantings were obviously not included in the Washington Office tabulations. During the thirties, most of the seedlings purchased by industry in some States were distributed to and planted on small ownerships.

Acreages planted are gross acreages. Although many acres were replanted there is no known way to come up with net acreages. On the Yazoo-Little Tallahatchie Flood Prevention Program in Mississippi, where nearly 800,000 acres (323,760 ha) of small ownerships have been planted, it has been necessary to replant 18 percent of the acreage during a 30-year period. Checks made when the plantations should be 15-years-old reveal that 13 percent no longer exist.

—Hamlin L. Williston

ACKNOWLEDGEMENTS

All statistics have been checked by the concerned State forestry agency. My thanks to these agencies and to Pieter E. Hoekstra, Clark W. Lantz, Mrs. Shirley Jones and Mrs. TyJuana Ray.
